1 INTRODUCTION

- *Natural Disasters Intensity Analysis and Classification using Artificial Intelligence is a network model that classifies the natural disaster and tells the intensity of disaster. The model uses an integrated webcam to capture the video frame and the video frame is compared with the Pre-trained model and the type of disaster is identified and showcased on the OpenCV window.*

a) PROJECT OVERVIEW

The project mainly classifies the type of Natural Disaster and the intensity by giving an image through the webcam. Natural disasters not only disturb the human ecological system but also destroy the properties and critical infrastructures of human societies and even lead to permanent change in the ecosystem.

b) PURPOSE

- Natural disasters are on the rise due to climate change.
- Artificial intelligence can improve disaster response, from reducing the time to assess damage to monitoring social media to more quickly and effectively deliver aid.
- It's important to be cautious about the limitations of AI, and more collaboration is key to maximize its benefits

2 LITERATURE SURVEY

Case study I AI -

THE NATURAL DISASTER Author- Jeff Catlin project descriptions
Fortunately, we have tools at our disposal that we can leverage to our advantage. Among them is AI, which you can implement to support and extend the capabilities of existing systems and personnel at every stage in the disaster life cycle.

Case study II -

AI can monitor disasters in the making Author- Jeff Catlin project description
A global disaster often begins at a hyperlocal hot spot. AI models that look for a spike of mentions or events across a set of identified domains and then cross-reference these against related data points can notify us about potential disasters before they strike.

Case study III TITLE AI

– NATURAL DISASTER -BRAIN DAVISON Brian D.

Davison teaches courses on data science, data mining, web search engines, networking, system administration, C and UNIX programming. His research is in web search and mining, focusing on the integration of text and link analysis applied to search and classification problems on the Web. Dr. Davison's interests additionally include information retrieval, social networking, data mining, network infrastructure for the WWW, and the analysis of trust and authority in information networks.

Case study IV TITLE AI

- NATURAL DISASTER Wenjuan Sun¹ ·

Paolo Bocchini¹ Abstract Natural hazards have the potential to cause catastrophic damage and significant socioeconomic loss. The actual damage and loss observed in the recent decades has shown an increasing trend. As a result, disaster managers need to take a growing responsibility to proactively protect their communities by developing efficient management strategies. A number of research studies apply artificial intelligence (AI) techniques to process disaster-related data for supporting informed disaster management. This study provides an overview of current applications of AI in disaster management during its four phases: mitigation, preparedness, response, and recovery. It presents example applications of different AI techniques and their benefits for supporting disaster management at different phases, as well as some practical AI-based decision support tools. We find that the majority of AI applications focus on the disaster response phase. This study also identifies challenges to inspire the professional community to advance AI techniques for addressing them in future research.

a) EXISTING PROBLEM

AI refers to technologies that mimic or even outperform human intelligence when performing certain tasks. ML, which is a subset of AI that includes supervised (e.g., random forest or decision trees), unsupervised (e.g., *K*-means) or reinforcement (e.g., Markov decision process) learning, can be simplified as parsing data into algorithms that learn from data to make classifications or predictions.

b) REFERENCES

Already, natural disasters occur four times as often as they did in 1970. According to estimates, such events could grow in frequency and ferocity with the effects of climate change. Artificial intelligence has potential to alleviate the damage by marshalling relief resources more efficiently and effectively.

c) PROBLEM STATEMENT DEFINITION

A problem statement is a tool to help guide your team toward building the right product. Defining AI problem statements well is important in pointing a path to a worthwhile AI product. It's easy to solve the wrong problems. Good design relentlessly questions assumptions, reframing the design problem to be solved.

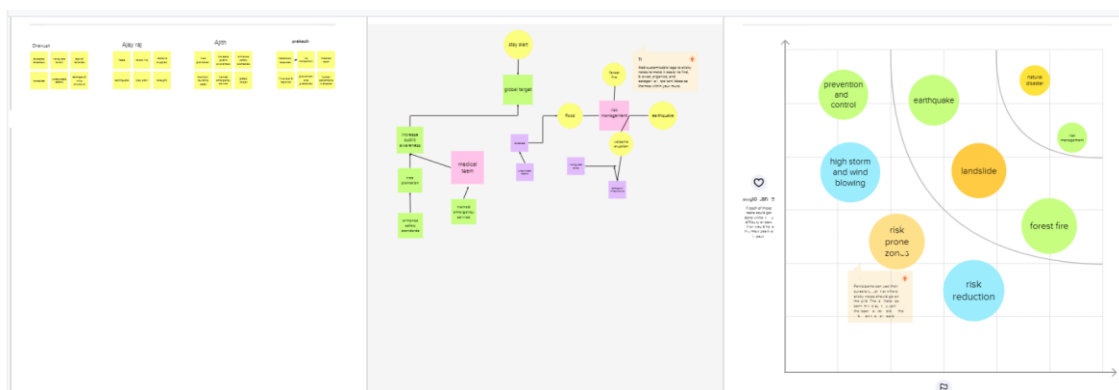

IDEATION & PROPOSED SOLUTION

a)

EMPATHY MAP CANVAS

b)
IDEATION & BRAINSTORMING

PROPOSED SOLUTION

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	I am student I'm trying to use this application, but I don't know how to use because I am using the application 1 st time which makes me feel disappointed.
2.	Idea / Solution description	Read the Instruction were given below and follow the instruction according to their rules.
3.	Novelty / Uniqueness	Prediction where place the major roll.
4.	Social Impact / Customer Satisfaction	It helps to feel easy while handling the software next time
5.	Business Model (Revenue Model)	By using the required, app will be gaining the profits.
6.	Scalability of the Solution	It has benefits for to predicting the climate .

PROBLEM SOLUTION FIT

a)FUNCTIONAL REQUIREMENT

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through organisation
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP
FR-3	User Accessibility	Confirmation of accessibility for image data to certain organisation via email provided
FR-4	User Accessibility 2	Accessible to instant weather data.
FR-5	Location Accessibility	Gain access to user location via mobile GPS to show the instant cyclone intensity
FR-6	Internet Availability	Internet is required to access the web page.

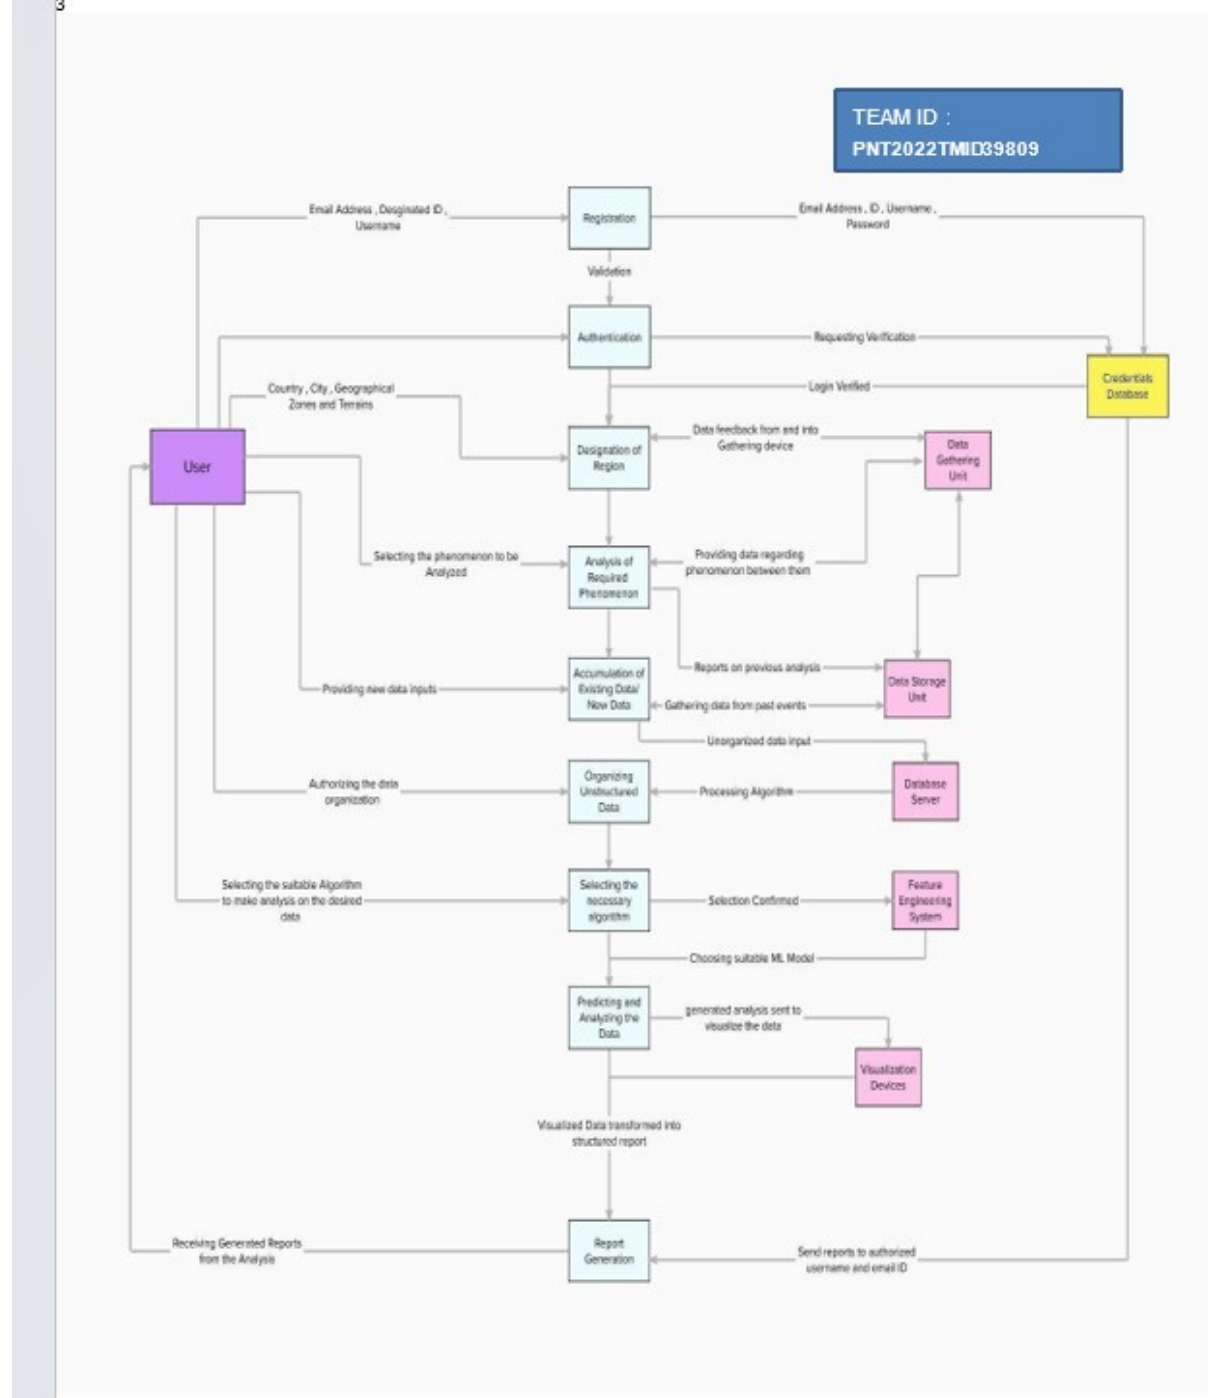

b) NON- FUNCTIONAL REQUIREMENT

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	Interactive UI is developed which facilitate easy navigation on the web page.
NFR-2	Security	It is highly secured since; the weather IR image data can be accessed by users of certain organization
NFR-3	Reliability	It is highly reliable since intensity of the cyclone is calculated for every 15 mins.
NFR-4	Performance	Since the model is trained with range of data it shows increased performance on every new instance

5) PROJECT DESIGN

a) DATA FLOW DIAGRAM

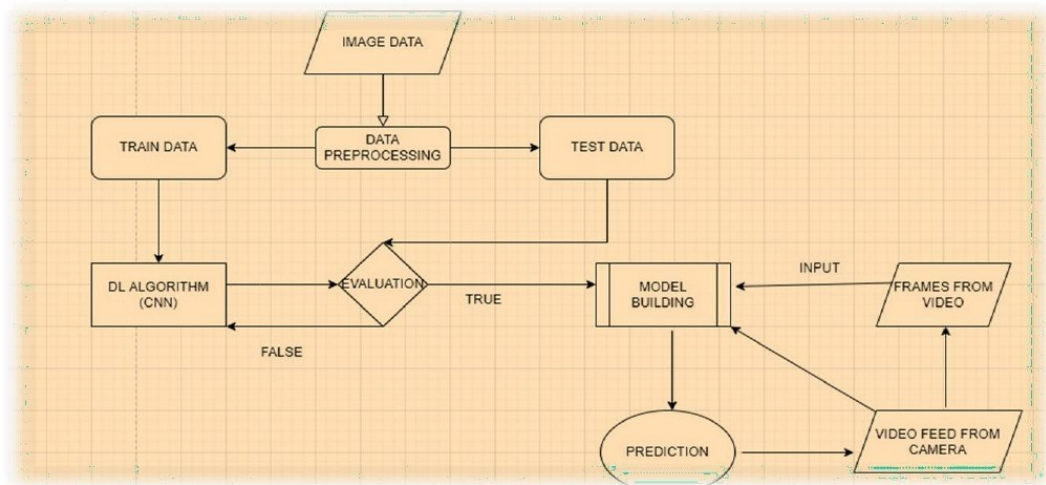

b) SOLUTION AND TECHNICAL ARCHITECTURE

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Example - Solution Architecture Diagram:

9) RESULT

Currently, AI can predict four types of natural disasters, including: Earthquakes: Researchers can feed AI systems information from seismic imaging to train them. **The AI analyzes the data to learn about the patterns of various earthquakes and can then predict where an earthquake and aftershock might hit**

10. ADVANTAGES

*** AI can also enhance earthquake detection and tsunami warning using geological information from research centres around the world.** Building up reliable datasets for such events is crucial, webinar speakers said.

Wildfires can also be studied in real time and detected earlier based on multi-sourced data

*To predict flooding, AI employs two main models: The Hydrological Model: This model is helpful for scientists in making water level predictions in a river. The Invasion Model: The model identifies the areas most likely to be hit by floods. This model can help avoid property damage and mortalities

Using a combination of AI-enabled drones and night-vision cameras, the AI can track the poachers and help the rangers stop them from hunting down the animals

DISADVANTAGES

In a disaster, **you face the danger of death or physical injury. You may also lose your home, possessions, and community.** Such stressors place you at risk for emotional and physical health problems. Stress reactions after a disaster look very much like the common reactions seen after any type of trauma.

AT SOME TIME IT MAY FAILS DUE TO THE CLIMATE CHANGES

Storms, floods, earthquakes, volcanoes, tsunamis and other natural disasters periodically wreak widespread destruction. In the United States alone, natural disasters cost more than \$300 billion in 2017, chiefly from a combination of hurricanes, tornadoes, drought and wildfire

CONCLUSION

Natural disasters, like floods, earthquakes or extreme climate outbreaks, severely challenge the health and welfare of people, animals and the ecosystem. The Conference on the Natural disasters and “One – Health” Are we prepared?, focused on preparedness and management of such crisis.

About 90 participants actively engaged in the discussions recognising that humans, animals and the

environment are interlinked and advocating the imperative of considering 'One Health' holistic approach as fundamental part of the whole exercise. Civil protection mechanisms should consider human and animal interactions as major factor in order ensure successful response.

12. FUTURE SCOPE

Scientific and technological advances in recent decades have greatly improved the nation's capability to predict most natural hazards and disseminate warnings based on those predictions. However, prediction accuracy and lead times vary with the type of hazard.

[<a href="https://ourworldindata.org/grapher/how-many-deaths-does-it-take-for-a-disaster-to-receive-news-coverage">](https://ourworldindata.org/grapher/how-many-deaths-does-it-take-for-a-disaster-to-receive-news-coverage)

The graph shows a positive correlation between the number of deaths and the time it takes for a disaster to receive news coverage. The x-axis represents the number of deaths, and the y-axis represents the time in days. The data points show that as the number of deaths increases, the time to receive news coverage also increases.

[<a href="https://ourworldindata.org/grapher/hurricane-landfalls-us">](https://ourworldindata.org/grapher/hurricane-landfalls-us)

The graph shows the number of hurricane landfalls in the United States from 1900 to 2020. The x-axis represents the year, and the y-axis represents the number of landfalls. The data shows a significant increase in landfalls starting around 1950, with a peak around 2005.

[<a href="https://ourworldindata.org/grapher/intensity-error">](https://ourworldindata.org/grapher/intensity-error)

The graph shows the intensity error for different disaster types. The x-axis represents the disaster type, and the y-axis represents the intensity error. The data shows that the intensity error is highest for earthquakes and lowest for hurricanes.

[<a href="https://ourworldindata.org/grapher/largest-impact-craters">](https://ourworldindata.org/grapher/largest-impact-craters)

The graph shows the diameter of the largest confirmed impact craters on Earth. The x-axis represents the diameter in kilometers, and the y-axis represents the number of craters. The data shows that there are a few very large craters, but many smaller ones.

[<a href="https://ourworldindata.org/grapher/near-earth-asteroids-discovered-over-time">](https://ourworldindata.org/grapher/near-earth-asteroids-discovered-over-time)

The graph shows the number of near-Earth asteroids discovered over time from 1900 to 2020. The x-axis represents the year, and the y-axis represents the number of discoveries. The data shows a steady increase in discoveries over time, with a significant jump around 2000.

<!-- rnb-text-begin -->
<p>This is an R Markdown
Notebook. When you execute code within the notebook, the results appear
beneath the code.</p>
<p>Try executing this chunk by clicking the Run button within
the chunk or by placing your cursor inside it and pressing
Ctrl+Shift+Enter.</p>
<p>Add a new chunk by clicking the Insert Chunk button on the
toolbar or by pressing Ctrl+Alt+I.</p>
<p>When you save the notebook, an HTML file containing the code and
output will be saved alongside it (click the Preview button or
press Ctrl+Shift+K to preview the HTML file).</p>
<p>The preview shows you a rendered HTML copy of the contents of the
editor. Consequently, unlike Knit, Preview does not
run any R code chunks. Instead, the output of the chunk when it was last
run in the editor is displayed.</p>
